

US Google Advertising Managers to Japan — Model-Grounded Training Report

Hofstede, Hall, Trompenaars, and World Values Survey /
Inglehart-Welzel

Intercultural Competence and Diversity Training

June 2026

Executive summary

This report trains managers from a **United States Google Advertising organization** who are being sent to **Japan**. The sector is digital advertising platform sales: managers sell advertising space, audience access, bidding, measurement, and platform advertising solutions. Advertisers remain responsible for their end-to-end creative and media execution.

The analysis is deliberately grounded in the four required cultural models only: Hofstede, Hall, Trompenaars, and the World Values Survey / Inglehart-Welzel cultural map. The models do not define individuals. They provide structured hypotheses for preparation, comparison, risk identification, and guideline development.

The core recommendation is: **make US speed legible as Japanese-quality control**. In practice this means pre-alignment before formal meetings, explicit risk boundaries, hierarchy-aware communication, private concern channels, and long-term trust/reputation framing.

1. Home culture and sector

The home culture is the **United States**. The sector is **advertising platform sales** inside Google Advertising. The relevant management task is not campaign development for advertisers but the sale and support of platform advertising solutions.

The US-side operating style is likely to include explicit communication, direct action orientation, lower tolerance for unclear ownership, and a preference for measurable next steps. These are model-based tendencies, not universal descriptions of every US manager.

2. Applying the models to the home culture: United States

Hofstede

In Hofstede's model, the United States is commonly interpreted as lower in power distance than many hierarchical business cultures, highly individualistic, relatively lower in uncertainty avoidance than Japan, and more indulgent/self-expressive. For managers, this supports expectations of accessible leadership, personal accountability, debate, and experimentation.

Hall

Hall's model frames the United States as relatively low-context: meaning is expected to be explicit in words, agendas, commitments, written summaries, and direct disagreement. This supports speed, but can under-read silence or indirect concern in Japan.

Trompenaars

Using Trompenaars, the US side can be read as more universalist, specific, achievement-oriented, sequential-time oriented, and internal-control oriented. Managers may expect rules, expertise, metrics, and clear ownership to be enough to move work forward.

World Values Survey / Inglehart-Welzel

The WVS lens places the United States among advanced societies with strong self-expression and voice expectations. In management terms, US managers may assume that speaking up publicly, disagreeing openly, and showing individual initiative are positive norms.

3. Host culture selection

The host culture is **Japan**. The business context is Japanese corporate and client-facing advertising platform work. The managers will interact with Google Japan colleagues, agencies, clients, and senior stakeholders in a Japan-based commercial environment.

4. Applying the models to the host culture: Japan

Hofstede

Japan is commonly interpreted as higher than the United States in uncertainty avoidance and long-term orientation, more hierarchy-conscious, and strongly achievement-oriented. The manager implication is that preparation, precision, stakeholder approval, quality, risk control, and reputation protection matter strongly before a proposal or platform pilot is accepted.

Hall

Japan is commonly used as a high-context comparison case. Meaning may be carried through silence, hesitation, relationship history, role, seniority, and indirect phrasing. A phrase such as “that may be difficult” can signal stronger reservation than the literal wording suggests.

Trompenaars

Japan can be read as more context-sensitive in implementation: rules matter, but role, relationship, status, obligation, and face affect how rules are introduced and executed. A global policy can be correct and still fail socially if it ignores hierarchy or face.

World Values Survey / Inglehart-Welzel

Japan is a modern, advanced society, not a simplistic “traditional” opposite of the US. The WVS lens is useful because it shows that advanced societies still differ in authority, trust, restraint, self-expression, and public voice patterns.

5. Thorough comparison between the cultures

Hofstede comparison

The strongest practical difference is uncertainty avoidance. US platform culture may normalize testing and optimization; Japanese stakeholders may need clearer safeguards before accepting a platform pilot or advertising-space recommendation. Japan’s higher long-term orientation also means that short-term performance arguments should be paired with trust, continuity, and reputation logic.

Hall comparison

The US side expects explicit messages; the Japan side may encode meaning in context. Therefore, US managers must not treat silence as consent. They should

ask concern-oriented questions and verify agreement privately when hierarchy is present.

Trompenaars comparison

US universalist/specific logic says: “the rule, owner, and KPI are clear.” Japan-sensitive implementation asks: “who must be aligned, how is face preserved, and how does the rule fit the relationship context?” This is not abandoning rules; it is making rules operational in context.

WVS / Inglehart-Welzel comparison

The US assumption that public voice and autonomy are always safe may not transfer cleanly. In Japan, input may need structured channels: pre-reads, 1:1s, written comments, senior-sponsor alignment, or smaller meetings.

6. Potential problem areas in this constellation

1. **Platform pilots feel under-controlled:** Hofstede’s uncertainty avoidance lens predicts discomfort with vague test-and-learn proposals.
2. **Indirect concerns are misread:** Hall’s context lens predicts that US managers may miss reservation expressed indirectly.
3. **Global rules are introduced too bluntly:** Trompenaars predicts friction if universalist policy logic ignores role, relationship, and face.
4. **Public voice is requested in the wrong channel:** WVS predicts that autonomy and disagreement need culturally safe expression channels.
5. **Short-term performance framing is too narrow:** Hofstede’s long-term orientation lens suggests the need to include reputation, continuity, and quality.
6. **Corrective feedback is too direct or public:** Hall and Hofstede together suggest that face and hierarchy must be protected.

7. Recommended guideline

Operating principle

Make US speed legible as Japanese-quality control.

Before the meeting

- Map formal decision-makers, informal influencers, implementation owners, and risk holders.
- Send a pre-read that includes rationale, scope, risk boundary, quality checks, and questions for feedback.
- Identify where disagreement can surface safely.

During the meeting

- Listen for silence, hesitation, deferral, and indirect phrasing.
- Ask concern-based questions: “What risks should we resolve before moving forward?”
- Avoid forcing junior people to disagree publicly with senior people.

After the meeting

- Send a precise written summary.
- Confirm approval path, owners, reporting cadence, and fallback triggers.
- Treat platform pilots as controlled recommendations, not casual experiments.

Final manager checklist

1. Hofstede: Have we made uncertainty and risk controllable?
2. Hall: Have we checked what was implied, not only what was said?
3. Trompenaars: Have we introduced rules through the right role/context channel?
4. WVS: Have we created safe ways for voice and disagreement?
